```
The present invention describes a human stress-phosphorylated endoplasmic
                                             reticulum protein, designated Nogo B. Nogo B has cytostatic activity and is a modulator of the storage and exchange of calcium, cell growth and cellular stress response. It can regulate oxidative stress; inhibit neurite outgrowth, neuron growth and axon regeneration. Nogo B polypeptides and polynucleotides are useful for modulating stress levels and cellular stress-response, cell growth and viability, diagnosis and treatment of cancer, malignant growth and other Nogo B related diseases. Nogo B polypeptides are also useful to screen combinatorial libraries to identify agonist or antagonist. Antibodies against Nogo B polypeptides are useful for add distinguishing Nogo B polypeptides polypeptides. The present sequence represents a human Nogo B phosphorothioate antisense oligonucleotide from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  se; diagnosis; non-blood disease; solid tumor; gene expression; peripheral blood mononuclear cell; renal cell carcinoma; prostate cancer; head/neck cancer; differential expression; probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relate to a method of diagnosing (M1) non-blood disease such as solid tumor by providing peripheral blood sample of human having
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Diagnosing non-blood disease such as solid tumor, involves comparing differential expression profile of specific genes in peripheral blood sample of subject with reference expression profile of specific genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Renal cell carcinoma differentially expressed gene probe #4032.
                                                                                                                                                                                                                                                                                                                             100.0%; Score 24; DB 3; Length 24; 100.0%; Pred. non-blood disease, and comparing an expression profile of specific genes in the peripheral blood sample to reference expression profile of the genes, where each of the genes is differentially expressed in peripheral blood mononuclear cells (FBMCs) of patients having the disease as compared to PBMCs of normal humans. The method is useful for diagnosing non-blood disease such as solid tumor. The solid tumor is chosen from renal cell carcinoma (RCC), prostate cancer and head/neck cancer. The peripheral blood sample comprises enriched PBMCs. The peripheral blood sample (claimed). (MI) is useful for identifying genes that are differentially expressed in peripheral blood samples isolated at different stages of progression, development or treatment of RCC and/or other solid tumors. This sequence corresponds to a probe to detect a gene that is differentially expressed and detected by the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; 88; antieense therapy; cytostatic; antiinflammatory; haemostatic; cerebroprotective; noctropic; neuroprotective; antiparkinsonian; muscular; D20; neurite growth inhibitor gene; NOG0; hammerhead ribozyme; DNAzyme; inozyme; g-cleaver; amberzyme; zinzyme; lrymphoma; leukaemia; B-cell lymphoma; non-Hodgkin's lymphoma; NHL; lymphocytic leukaemia; Muman immundeficiency virus; HIV associated NHL; mantle-cell lymphoma; MCL; immunocytoma; IMC; immune thrombocytopaenia; stroke; dementia; inflammatory arthropathy; central nervous system injury; cherebrocytoma; acident; CVA; Alzheimer's disease; multiple sclerosis; chemotherapy-induced neuropathy; amyotrophic lateral sclerosis; ALS; parkingon's disease; ataxia; Huntington's disease;

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down cegulates expression of a neurite growth inhibitor gene (NGOD). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acid cleaving an RNA molecule possessing an NGH motif), a G-cleaver (cleaving RNA with a NGH motif), a G-cleaver (cleaving RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably Mg^2+.

Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, he CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular NHL, lymphocytic CC leukaemia, HIV (human immunocytoma (IMC), small B-cell lymphocytic lymphoma, immunocytoma (IMC), small B-cell lymphocytic lymphoma, immunocytoma (IMC), small B-cell lymphocytic lymphoma, immunocytoma (IMC), small B-cell lymphocytic lymphoma, immunocytoma (IMC), small B-cell lymphocytic lymphoma, immunocytoma (IMC), small B-cell lymphocytic lymphoma, immunocytoma (IMC), small B-cell lymphocytic lymphoma, immunocytoma (IMC), small B-cell lymphocytocytopaenia, and inflammatory arthropathy. The NOGO gene in the presence of a divalent cation that is preferably Mg²+. Furthermore, the comprise of a divalent having a condition associated with the level of the cell and treat a patient having a condition associated with the level of the NoGO enter or man of the NOGO enter or more or a man or the nogo or more or a man or the nogo or more or a man or more or a man or more or a man or more or a man or more or a man or more or more or more or more or more or more or more or more or more or more or more or more or more or 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                therapies. In particular, the NOGO-targetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of NOGO expression. sapiens.

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and Chowrira BM; Blatt L, Mcswiggen J, WPI; 2001-607195/69.

Claim 88; Page 90; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down cregulates expression of a neurite growth inhibitor gene (NGOD). The cregulates expression of a neurite growth inhibitor gene (NGOD). The cregulates expression of a neurite growth inhibitor gene (NGOD). The consessing an NGH motif), a G-cleaver (cleaving RNA with a NGW with an NGW triplet), a zinzyme (cleaving RNA with an NGW triplet), a zinzyme (cleaving RNA with an NGW triplet), a zinzyme (cleaving RNA with an NGW triplet), a zinzyme (cleaving RNA with an NGW triplet), a zinzyme (cleaving RNA cc of CD20 in the presence of a divalent cation that is preferably MG² +. C Purthermore, it may be contacted with a condition associated with the level conformed to the call and treat a patient having a condition associated with the level conformed in particular, the CD20 targetting nucleic acid may be used to treat lymphoma (NHL), bulky low-grade or follicular noncertangles. In particular, B-cell lymphoma, low-grade or follicular noncertangles. In munnocytoma (IMC), small B-cell lymphocytic lymphocytic lymphocytic lymphocytic lymphocytic acid is used to cleave RNA of the NGOO gene in the craspetting nucleic acid may be contacted with a cell to reduce NGOO gene in the craspetting nucleic acid may be contacted with a cell to reduce NGOO gene in the cell and treat a patient having a condition associated with the level of concot not more cell and treat a patient having a condition associated with the level of concot the rapies. In particular, the NGOO-targetting nucleic acid may be used to the use of one or more

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down cegulates expression of a neurite growth inhibitor gene (NGOD). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme (an endolytic nucleic acid (e.g. a ribozyme or a makersyme (cleaving RNA with an NGW triplet), a zinzyme (cleaving RNA cyth a CD20 in the presence of a divalent cation that is preferably Mg^2+. Furthermore, if may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more cof CD20. The treatment may further comprise the use of one or more treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular NHL, lymphocytic Leukaemia, HTV (human immunodeficiency virus) associated NHL, mantle-cell lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic, lumphoma, immunodeficiency virus) associated NHL, mantle-cell lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic, lumphoma, immunodeficiency virus) associated NHL, lymphoma, immunoteficiency arthropathy. The NOGO gene in the comprise of a divalent cation that is preferably Mg²+. Furthermore, the nucleic acid may be contacted with a cell to reduce NOGO activity of the contacted with a cell to reduce NOGO activity of the contacted with a cell to reduce now or more tharasise the use of none or more reduced to the parasise the use of none or more reduced to the parasise the use of none or more reduced to the parasise the use of none or more reduced to the parasise the use of none or more reduced to the parasise the use of none or more reduced to the parasise the use of none or more reduced to the parasise the use of none or more reduced to the parasise the u
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             therapies. In particular, the NGGO-targetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), Parkinson's disease, ataxia, huntington's disease, Creuzzfeldt-Jakob disease, muscular dystrophy, and/or other neurodegenerative disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       which respond to the modulation of NOGO expression. The present
                                                                                                                                                                                                                                                                                                                                                                         Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The invention relate to a method of diagnosing (M1) non-blood disease such as solid tumor by providing peripheral blood sample of human having non-blood disease, and comparing an expression profile of specific genes in the peripheral blood sample to reference expression profile of the genes in the peripheral blood sample to reference expression profile of the genes, where each of the genes is differentially expressed in peripheral blood mononuclear calls (PBMCs) of patients having the disease as compared to PBMCs of normal humans. The method is useful for diagnosing non-blood disease such as solid tumor. The solid tumor is chosen from renal cell carcinoma (RCC), prostate cancer and head/neck cancer. The peripheral blood sample comprises enriched PBMCs. The peripheral blood sample (claimed) (M1) is useful for identifying genes that are differentially expressed in peripheral blood samples of progression, development or treatment of RCC and/or other solid tumors. This sequence corresponds to a probe to detect a gene, that is differentially expressed and detected by the method ö Gaps ö 70.8%; Score 17; DB 12; Length 25; 82.4%; Pred. Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.

Claim 88; Page 90; 200pp; English.

Expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGCO). The regulates expression of a neurite growth inhibitor gene (NGCO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids and nucleic acids and the a nucleic acids and the a nucleic acids and the an INN motif) and amberzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA cf coll to the real and treat a patient having a condition associated with the level coll to reduce CD20 activity of the cell and treat may further comprise the use of one or more cof CD20. The treatment may further comprise the use of one or more cof coll to particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular NHL, lymphocytic leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell lymphoma (MCL), immunocytoma (MMC), small B-cell lymphocytic lymphoma, immunocytoma (MMC), small acid is used to claave RNA of the NGCO gene in the cragetting nucleic acid may be condated with a cell to reduce NGCO activity of the collicie acid may be condated with a cell to reduce MCCO activity of the collicie acid may be condated with a cell to reduce NGCO activity of the collicie acid may be condated with a cell to reduce MCCO activity of the NGCO. The treatment may further comprise the use of one or more contral nervous system (CNS) injury and certoral acid acid sease, demental, muscular dystrophy, and/condated acid acid sease, centered or acid sease, ataxia, Huntingt sequence is an inozyme of the invention

the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more thereapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-foldskin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic leukaemia, HV (human immunodeficiency virus) associated NHL, lymphocytic lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, immune thrombocytopaenia, and inflammatory arthropathy. The NOGO-targetting nucleic acid is used to cleave RNA of the NOGO gene in the presence of a divalent cation that is preferably MG'2+. Furthermore, the presence of a divalent cation that is preferably MG'2+. Furthermore, the cell and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more therapies. In particular, the NOGO-targetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CNA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), Parkinson's disease, muscular dystrophy, and/or other neurodegenerative disease creates which respond to the modulation of NOGO expression. The present

with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of the human Lck polypeptide and in preparation of a composition for treating hyperproliferative disorders, e.g. cancer. This sequence represents a PCR primer used to amplify DNA encoding a human Lck polypeptide of the
compound is an antisense oligonucleotide that specifically hybridises

Human RecQ protein-like 4 (RECQL4) DNA antisense oligonucleotide #32

(first entry)

20-NOV-2002

ABS6889;

```
New antisense compounds targeted to nucleic acids encoding RecQ protein-
like 4, useful for modulating expression of the nucleic acid and treating
diseases associated with expression of the nucleic acid in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a compound targeted to specific nucleobases of RecQ protein-like 4 (RECQL4) and which hybridises and inhibits the expression of RECQL4. The compound is useful for inhibiting the expression of RECQL4 in cells or tissues and for treating an animal, particularly a human suspected of having or being prone to a disease or condition associated with expression of RECQL4. The compound is useful for diagnostics, therapeutics and as a research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. This sequence represents an antisense oligonucleotide used in inhibition of human RECQL4 expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 20 BP; 3 A; 8 C; 5 G; 4 T; 0 U; 0 Other;

PCR primers AAV05322-23 are used in a reverse transcription polymerase there reaction (RT-PCR) to amplify bcl-2 cDNA from human, rat, or mouse throws total RNA. Bcl-2 genes are anti-apoptotic genes whose products prevent unwanted death of certain cell populations, and are useful for treating neurodegenerative diseases such as Huntingdon's, Parkinson's or Alzheimer's disease. The PCR product was ligated into retroviral vectors LNXS and LNXX, to produce retroviral vectors LNXS-bcl-2 and LNXC-bcl-2. The vectors are used to transfect live packaging cells which form the secret a biocompatible capsule. These packaging cells which form the secret a viral vector which includes a heterologous gene (in this case bcl-2) encoding a biologically active compound e.g. antisense sequence,

The present invention describes originalizated in describing messenger RNAs that populate a (sub-)transcripted from multiple transcription units that populate a genome. The library comprises several oligonuclectides, each capable of phyridising selectively to a set of messenger RNAs transcription unit of the genome, which encodes one or more messenger RNA splice variants. The encodes one or more messenger RNA splice variants. The oligonuclectide libraries are useful for detecting mRNAs from a coligonuclectide libraries are useful for detecting mRNAs from a biological sample, in expression profiling studies, in qualitatively or caracterising the corresponding transcriptor, and in certanscripts and splice variants of human or animal consecuting RNA transcripts and splice variants of human or animal consecuting RNA transcripts of a sub-transcriptome under a particular consecution or pathological state, and so allowing the detection of tissue to any pathology-specific genes such as those genes only expressed in specific genes; and to detect RNA transcriptome of a pathent suffering from a particular consecution. ABN27253 to ABNS9589 represent oligonuclectide sequences from cates, invention. N.B. The sequence data for this patent did not form to part of the printed specification, but was obtained in electronic format consecutive from WIPO at ftp. wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          selectively hybridize to mRNAs transcribed from a transcription unit of a genome, useful for detecting tissue-, pathology-, and developmental-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 present invention describes oligonucleotide libraries for detecting
                                                                                                                                                                                                                       Human spliced transcript detection oligonucleotide SEQ ID NO:6841.
                                                                                                                                                                                                                                                           Human; mouse; rat; splice transcript; detection; RNA transcript; splice variant; transcriptome; oligonucleotide library; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       oligonucleotide libraries comprising oligonucleotides which

Polymorphic nucleic acids encoding e.g. amylases, cyclins, polymerases, oncogenes and histones, useful for diagnosing and treating, e.g. cancer, autoimmune diseases and infections.

Claim 1; Page 1539; 4143pp; English

The present invention relates to oligonucleotides encoding polymorphic variants of proteins related to amylases, amyloid proteins, angiopoietin, apptomets related proteins, cadherin, cyclin, polymerses, oncogenes, histones, kinases, colony stimulating factors, complement related proteins, cytochromes, kinesins, cytokines, interferons, interleukins, Groteins, cytochromes, kinesins, cytokines, interferons, interleukins, Groteins, coupled receptors and thioesterases. The present sequence is one such oligonucleotide. The oligonucleotides and the peptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of the proteins listed above. Disorders that may be prevented, diagnosed and/or treated include multifactorial diseases with a genetic component, such as autoimmune configurates (e.g. rheumatoid arthritis, multiple sclerosis, diabetes, systemic lupus erythromatosus and Grave's diseases), inflammation, cancer (e.g. cancers of the bladder, brain, breast, colon and kidney, leukaemia), diseases of the nervous system and an infection of pathogenic

The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch oritice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleoride kinase. Adaptor oligonucleorides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gi|4732114|gb|AP129072.1), a copy.number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to

/note="Vector: PWD42nv; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resources documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was hydrodynamically shapered by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end repaired with T4 DNA polymerase and T4
polymuclecide kinase. Adaptor oligomuclectides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gf rom a derivative
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gi|4732114|gb|AF129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to

The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114|gb|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to

/note="Vector: PWD42nv; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from He Jackson
Laboratory Mouse DNA Resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end repaired with T4 DNA polymerase and T4
polynucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pwD42 (gi|4732114|gb|AF129072.1); a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
chemically-competent E. coli Xil0-Gold (Stratagene) cells
and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      BH851910 30 bp DNA linear GSS 13-JUN-2002 SALK 073697.35.80.x Arabidopsis thaliana TDNA insertion lines Arabidopsis thaliana genomic clone SALK_073697.35.80.x, genomic

Bay Area Functional Genomics Consortium (BayGenomics)
Bayl: infoobaygenomics.ucsf.edu
Sequence tag generated by 5' RACE of total RNA from gene trap ES
cell line. ES cell lines harboring insertion mutation of target
gene are available upon request from BayGenomics. Annotation
information available from

//note="Vector: pBluescript II XR; Site_1: EcoRi; Site_2: Xhoi; Root canNa. The mRNA was isolated from entire roots of 8 day old 'Williams' seedlings which were propagated on paper towels with distilled water. Stratagene's CDNA Synthesis with (catalog #200401) was used to synthesize the CDNA. First-strand synthesis was performed with 5-methyl dCTP, hence the ligated cDNA is hemimethylated. Stratagene's first-strand synthesis primer was used (GAGAGAGAGAGAACAGACAGACAGAGAACTAGTCTCGAG(T)-18]. After second-strand synthesis, the cDNA ends were 'polished' with clone Pfu DNA polymerase, ligated to EcoRI adapters, and phosphorylated. The Xhoi site within the first-strand synthesis primer was restricted by digestion with Xhoi; all Xhoi sites in the cDNA would be protected by their hemimethylated status. The cDNA constructs ware size-fractionated attue. The cDNA constructs were size-fractionated with a SOUDp cutoff, using GibcoRR Life Technologies' cDNA Size Fractionation column. The column eluent was then ligated into Stratagene's pBluescript II XR Predigested vector (pBluescript II SK(+) that had been digested with EcoRI and Xhoi, and phosphorylated). Both the white and blue colonies appear to contain recombinant plasmids with cDNA inserts. Blue colonies 9n=15) have been sequenced, and possesse putative colonies 9n=15) have been sequenced, and possesse putative colonies ylaseria.

was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWDA2 (gil472114|gb|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 plasmid inserts

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             fincte-PCR was performed on DNA of primary transformants of Orysa sativa plants. The DNA fragment(s) resulting of PCR were directly sequenced from the left border to determine the genomic sequence flanking the insertion. T-DNA derived sequences were removed. Information to order the corresponding mutant line and a link to a database providing a graphical display is available from june 2004 at http://genoplante-info.infobiogen.fr/oryzatagline/. This sequence has been generated in the framework of the Prench plant genomics program Genoplante
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /clone lib="Flanking Sequence Tag of Oryza sativa T-DNA insertIon lines"

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Description

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 1

Sequence 1533, Application US/09780533A

Publication No. US20030060611A1

GENERAL INFORMATION:

APPLICANT: Ribozyme Pharmaceuticals, Inc.

APPLICANT: Glowingen, Jim

APPLICANT: APPLICANT: Abarat

APPLICANT: Haeberli, Phed and Reagent for the Inhibition of NOGO Gene

TITLE OF INVENTION: Method and Reagent for the Inhibition of NOGO Gene

FILE REFERENCE: MBHB00, 878-A (400/011)

CURRENT APPLICATION NUMBER: US/09/780,533A

CURRENT FILING DATE: 2000-102-09

PRIOR APPLICATION NUMBER: US 60/181,797

Publication No. US20030060611A1

GENERAL INFORMATION:
APPLICANT: Ribozyme Pharmaceuticals, Inc.
APPLICANT: Blatt, Larry
APPLICANT: Acwiggen, Jim
APPLICANT: Acwiggen, Jim
APPLICANT: Habberli, Pete
TITLE OF INVENTION: Method and Reagent for the Inhibition of NOGO Gene
FILE REPRENCE: MBHB00,878-A (400/011)
CURRENT APPLICATION NUMBER: US 60/181,797
PRIOR PILING DATE: 2001-02-09
PRIOR FILING DATE: 2000-02-11
PRIOR FILING DATE: 2000-02-11
SROITMARE: PatentIn version 3.0
SEQ ID NO 2081
JAPELICANT: Ribozyme Pharmaceuticals, Inc.

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Description

Sequence 1429, Application US/09780533A

Publication No. US20030606611A1

GENERAL INFORMATION:

APPLICANT: Ribozyme Pharmaceuticals, Inc.

APPLICANT: Blatt, Larry

APPLICANT: Achira, Bharat

APPLICANT: Haeberli, Pete

TITLE OF INVENTION: Method and Reagent for the Inhibition of NOGO Gene

FILE REFERENCE: MBHBOO, 878-A (400/011)

CURRENT PILING DATE: 2001-02-03

PRIOR FILING DATE: 2000-02-11

PRIOR FILING DATE: 2000-02-11

NUMBER OF SEQ ID NOS: 6679

SOFTWARE: PatentIn version 3.0
